## METHOD AND APPARATUS OF CONTROLLING A RESET PROCEDURE IN A WIRELESS COMMUNICATION SYSTEM

## **Abstract**

A method of controlling a reset procedure sets a proper clocked period to the timer Timer\_Status\_Prohibit for blocking the timer Timer\_Status\_Period from interfering with the counting of the state variable VT(RST). In addition, the method of controlling a reset procedure makes use of an amended triggering condition. Therefore, the sender ignores the STATUS PDUs when the reset procedure is ongoing. To sum up, the state variable VT(RST) is not incremented abnormally, and the reset procedure behaves correctly according to the configured protocol parameter MaxRST.
